

IELTS READING – Why zoos are good
S21AT2

IELTS Reading Why zoos are good reading practice test has 10 questions..

Scientist David Hone makes the case for zoos

A. In my view, **q18 it is perfectly possible for many species of animals living in zoos or wildlife parks to have a quality of life as high as, or higher than, in the wild.** **q17 Animals in good zoos get a varied and high-quality diet with all the supplements required,**

and any illnesses they might have will be treated. Their movement might be somewhat restricted, but they have a safe environment in which to live, and they are spared bullying and social ostracism by others of their kind. They do not suffer from the threat or stress of predators, or the irritation and pain of parasites or injuries. The average captive animal will have a greater life expectancy compared with its wild counterpart, and will not die of drought, of starvation or in the jaws of a predator. A lot of very nasty things happen to truly ‘wild’ animals that simply don’t happen in good zoos, and to view a life that is ‘free’ as one that is automatically ‘good’ is, I think, an error. Furthermore, zoos serve several key purposes.

B. Firstly, zoos aid conservation. **q14 Colossal numbers of species are becoming extinct across the world, and many more are increasingly threatened and therefore risk extinction. Moreover, some of these collapses have been sudden, dramatic and unexpected,** or were simply discovered very late in the day. A species protected in captivity can be bred up to provide a reservoir population against a population crash or extinction in the wild. **q19 A good number of species only exist in captivity,** with many of these living in zoos. Still more only exist in the wild because they have been reintroduced from zoos, or have wild populations that have been boosted by captive bred animals. Without these efforts there would be fewer species alive today. Although reintroduction successes are few and far between, the numbers are increasing, and the very fact that species have been saved or reintroduced as a result of captive breeding proves the value of such initiatives.

C. Zoos also provide education. Many children and adults, especially those in cities, will never see a wild animal beyond a fox or pigeon. **q20 While it is true that q16 television documentaries are becoming ever more detailed and impressive, and many natural history specimens are on display in museums,** there really is nothing to compare with seeing a living creature in the flesh, hearing it, smelling it, watching what it does and having the time to absorb details. That alone will bring a greater understanding and perspective to many, and hopefully give them a greater appreciation for wildlife, conservation efforts, and how they can contribute.

D. In addition to this, **q21 there is also the education that can take place in zoos through signs, talks, and presentations which directly communicate information to visitors about the animals they are seeing and their place in the world. This was an area where zoos used to be lacking,** but they are now increasingly sophisticated in their communication and outreach work. **q23&24 Many zoos also work directly to educate conservation workers in other countries or send their animal keepers abroad to contribute their knowledge and skills to those working in zoos and reserves,** thereby helping to improve conditions and reintroductions all over the world.

E. Zoos also play a key role in research. If we are to save wild species and restore and repair ecosystems we need to know about how key species live, act, and react. **q15 Being able to undertake research on animals in zoos where there is less risk and fewer variables means real changes can be effected on wild populations.** Finding out about, for example, the oestrus cycle of an animal or its breeding rate helps us manage wild populations. Procedures such as capturing and moving at-risk or dangerous individuals are bolstered by knowledge gained in zoos about doses for anaesthetics, and by experience in handling and transporting animals. This can make a real difference to conservation efforts and to the reduction of human-animal conflicts and can provide a knowledge base for helping with the increasing threats of habitat destruction and other problems.

F. In conclusion, considering the many ongoing global threats to the environment, it is hard for me to see zoos as anything other than essential to the long-term survival of numerous species. **q25&26 They are vital not just in terms of protecting animals, but as a means of learning about them to aid those still in the wild, as well as educating and informing the general population about these animals and their world so that they can assist or at least accept the need to be more environmentally conscious.** Without them, the world would be, and would increasingly become, a much poorer place.
